

LoRaWAN® What is LoRaWAN®?

LoRaWAN® enables the wireless networking of devices and sensors over long distances with low energy consumption and high security.

LoRaWAN® is based on an open and standardized technology supported by a variety of device manufacturers and network operators.

The range of LoRaWAN® is several kilometers, depending on the environment and transmission power, making it particularly suitable for use in rural areas or industrial environments. Although the transmission speed is low compared to other wireless networks, it is sufficient for most IoT applications, where reliable and energy-efficient data transmission is paramount. The energy consumption is so low that the very cost-effective sensors and actuators can transmit independently for several years without recharging.
